(a) what the representation is able to encode
wrong prediction
the voxel is occupied, the label on it is wrong
softmax has to spread over classes
visible to confidence
missing prediction
no dynamic class anywhere inside the box
softmax votes 'free' at 0.992
identical to observed empty road, which votes 1.000
ground-truth class
wrong class
free
(b) confidence: AUROC 0.7193
correct (n = 31,588)
wrong class (n = 1,370)
missed (n = 7,905)
medians 0.992 vs 1.000
the curves nearly coincide
cumulative fraction of objects
max softmax probability in box
(c) observability: AUROC 0.7623
no observability at all:
48% of missed, 12% of correct
observability O in box
